Project Proposal

SaS News (Save and Share News)

Overview:

SaS News is a mobile application for the people who look out for news every second. Using this application, users can view past/present news articles, save and share news articles.

What problems will our project target to solve?

After taking a short interview with our fellow mates (considering them as dummy customers), we realized that there were many news apps in the market, but there weren't any which provides features such as listening to news articles, saving and sharing news articles, so that users can read that article in future etc. So, we concluded to design a News application that solves few of the major issues which weren't provided by already existing apps.

Primary problems solved by our project:
1. News Readers not only can read news articles, but they can also listen to news articles.
2. Adding "Save Article" feature is useful for many aspirants who are preparing for competitive exams like UPSC.
3. There is no share feature in existing apps, hence we decided to provide share feature itself in the app where we share articles with the friends we made in the app.

Why is it important?

Saving articles is helpful for many aspirants who are preparing for competitive exams. So, we mainly focus on providing additional features such as "Save, Share and listen" which will be helpful to many aspirants and people who prefers to listen to news every day.

What will our project do?

SaS News is a mobile application which provides the following functionalities for the users:

- View live news articles along with categorization
- View past news articles
- Save news articles
- Can make friends in the application itself
- Share news articles with friends made in the platform
- Listen to news articles

This application mainly targets the crowd who would like to read/listen to everyday and aspirants who are preparing for competitive exams.

Justification:

1.Goalset: The goal of our project is to provide many useful features to already existing kind of apps which proves that project is not too ambitious as well as concept of our project is quite new and is not explored by anyone yet so it makes it quite unique for our team as we need to work on it, completely from scratch by ourselves.

2. Skillset: Few team members of the team are great in frontend and rest are expert in backend which makes our team a great match for the project we chose as it requires lots of work in frontend and lots of work in backend for creating API's and managing database.

Considering these points, we can conclude that our project is neither too ambitious nor too easy, our team size and timeline are optimal.
